

Turns an idea into a governed, deployment-aware plan — **with a human-approval gate in front of every agent.**

PFactory Planning Portal — plans flow queue to human review to shipped

WHAT SHIPPED

A planning pipeline

Plans flow from ready, through a human-review approval gate, to shipped — visualised as a live board.

Code-aware planning

PFactory reads the existing codebase to plan brownfield changes and cross-language rewrites, not just greenfield specs.

Latest models

Planning runs on the current model lineup, defaulting to Claude Opus 4.8 with Sonnet 5 available per stage.

Deployment-aware planning

Plans now understand where the software will run, so the build and test stages inherit a real deployment contract.

The unified shell

The portal switcher, global Cmd-K search, and fleet 'needs you' badge now live here too.

A governance gate

Every agent-produced plan waits for human approval before it can emit and hand off downstream.

THE PATH FORWARD

The path forward: deeper code-aware planning, richer deployment contracts, and an audit trail that makes every plan traceable from requirement to reviewed pull request.
